

## ACIDS/BASES

hydrochloric acid =  $\text{HCl}$ , strong  
 sulfuric acid =  $\text{H}_2\text{SO}_4$ , strong  
 nitric acid =  $\text{HNO}_3$ , strong  
 carbonic acid =  $\text{H}_2\text{CO}_3$ , weak  
 phosphoric acid =  $\text{H}_3\text{PO}_4$ , weak  
 ethanoic acid (acetic acid) =  $\text{CH}_3\text{COOH}$ , weak

sodium hydroxide =  $\text{NaOH}$ , strong ← group 1/2 hydroxides = strong

magnesium hydroxide =  $\text{Mg}(\text{OH})_2$ , strong

sodium oxide =  $\text{Na}_2\text{O}$

ammonia =  $\text{NH}_3$ , weak

sodium carbonate =  $\text{Na}_2\text{CO}_3$ , weak

## ACID PRODUCES $\text{H}^+$ IONS

e.g.  $\text{HCl} \rightarrow \text{H}^+ + \text{Cl}^-$

## BASE PRODUCES HYDROXIDE IONS

e.g.  $\text{NaOH} \rightarrow \text{Na}^+ + \text{OH}^-$

## ANIONS PRODUCED FROM ACIDS

$\text{Cl}^-$  ← chloride from hydrochloric acid ( $\text{HCl}$ )

sulfate ( $\text{SO}_4^{2-}$ ) from sulfuric acid ( $\text{H}_2\text{SO}_4$ )

nitrate ( $\text{NO}_3^-$ ) from nitric acid ( $\text{HNO}_3$ )

phosphate ( $\text{PO}_4^{3-}$ ) from phosphoric acid ( $\text{H}_3\text{PO}_4$ )

carbonate ( $\text{CO}_3^{2-}$ ) from carbonic acid ( $\text{H}_2\text{CO}_3$ )

ethanoate ( $\text{CH}_3\text{COO}^-$ ) from ethanoic acid ( $\text{CH}_3\text{COOH}$ )

## REACTIONS OF ACIDS

acid + metal hydroxide  $\rightarrow$  salt +  $\text{H}_2\text{O}$

acid + metal oxide  $\rightarrow$  salt +  $\text{H}_2\text{O}$

acid + reactive metal  $\rightarrow$  salt +  $\text{H}_2$

acid + carbonate  $\rightarrow$  salt +  $\text{CO}_2$  +  $\text{H}_2\text{O}$

acid + hydrogen carbonate  $\rightarrow$  salt +  $\text{CO}_2$  +  $\text{H}_2\text{O}$

## REACTIONS OF BASES

base (a metal hydroxide or oxide) + acid  $\rightarrow$  salt +  $\text{H}_2\text{O}$

base + ammonium salts  $\rightarrow$  salt +  $\text{H}_2\text{O}$  +  $\text{NH}_3$

## NON REACTIVE METALS

- copper
- aluminium
- silver
- gold
- mercury

## EXAMPLES OF SALTS

- sodium nitrate
- calcium sulfate
- aluminium chloride
- magnesium acetate (or magnesium ethanoate)

## INDICATORS

### litmus paper

acidic  
blue litmus  $\rightarrow$  red

alkaline/basic  
red litmus  $\rightarrow$  blue  
neutral  
purple

### phenolphthalein

acidic  
colourless

basic  
pink

### bromothymol blue

acidic  
yellow

neutral  
green

basic  
blue

### universal indicator

red (pH < 3) = strong acid

orange/yellow (pH 3-6) = weak acid

green (pH 7) = neutral

blue (pH 8-11) = weak alkali

purple (pH > 11) = strong alkali

## CONVERTING

e.g.	mol L <sup>-1</sup>	g L <sup>-1</sup>	ppm
$\text{H}_2\text{SO}_4$	= 2.0	= (2)(2+32+64) = 196	= $\frac{196}{1000} \times 10^6$ = 196,000

mol/L  $\rightarrow$  grams/L =  $\times M$

grams/L  $\rightarrow$  mol/L =  $\div M$

ppm  $\rightarrow$  g/L =  $\div 1000$

g/L  $\rightarrow$  ppm =  $\times 1000$

ppm  $\rightarrow$  mol/L =  $\div 1000 \div M$

mol/L  $\rightarrow$  ppm =  $\times 1000 \times M$

~~ppm = 1000 x g/L~~  
~~g/L = ppm / 1000~~  
~~mol/L = g/L / M~~  
~~g/L = mol/L x M~~  
~~ppm = mol/L x 1000 x M~~  
~~mol/L = ppm / (1000 x M)~~

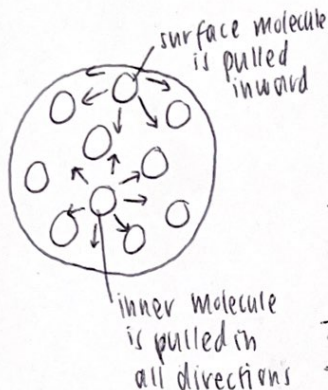

# WATER

- $H_2O$
- polar
  - v-shaped
  - main IMF = hydrogen bonding

↓  
between pos H and lone pair on O atoms

↓  
relatively strong electrostatic attraction

## PROPERTIES

### high melting + boiling point

- H-bonds = hard to overcome unless enough energy is used
- potential for one  $H_2O$  to form up to 4 H-bonds with surrounding  $H_2O$  molecules. increased energy needed to overcome all the forces to turn  $H_2O$  from liquid  $\rightarrow$  gas

### density in solid + liquid phases

- water cools, molecules slow down
- arranged so each forms 4 H-bonds w/ adjacent  $H_2O$ s
- $\rightarrow$   $\uparrow$  space between molecules
- $\therefore \uparrow$  volume of ice
- $\therefore$  ice = less dense than  $H_2O$
- $\therefore$  floats

### surface tension

- resistance of a liquid to increase surface area
- $H_2O$  has  $\uparrow$  (relatively) surface tension
- $\hookrightarrow$  due to strong IMF (H-bonds)
- $H_2O$  molecules only form bonds w/ ~~above~~ <sup>below</sup> + next to them
- there is no/minimal force of attraction in outward direction
- $\hookrightarrow$  cohesive forces  $>$  adhesive forces
- $\hookrightarrow$  net force pulling molecules down/in
- strong force = tendency to stay in shape, resisting disruptive forces
- $\therefore$  tension that makes the surface behave like a thin, stretched skin
- $\hookrightarrow$  because  $H_2O$  molecules on the surface are so attracted to each other via strong H-bonds

### other notes:

- cohesive particles
- $\hookrightarrow$  the molecules all want to stick to each other, (helps explain surface tension)
- adhesive properties
- $\hookrightarrow$  molecules stick to other surfaces
- $\uparrow$  heat capacity
- $\hookrightarrow$  water takes a lot of energy before there is a change in temp. compared to other substances
- latent heat of vapourisation
- $\hookrightarrow$  water needs a lot of PE to make a change from liquid  $\rightarrow$  gas

## SOLUTIONS

- solution = homogeneous mixture (uniform composition)
- forms from solute + solvent
- $\uparrow$  in a smaller amount than solvent
- max. amount of solute = saturated
- less than  $\uparrow$  then unsaturated
- more than max. = supersaturated
- aqueous solution is formed when a solid, liquid or gas dissolved in water ( $H_2O$  = solvent)

### DISSOLUTION - PROCESS OF DISSOLVING
